

INTRODUCTION TO JAVA FOR NON-C PROGRAMMERS

LABS

- ❶ Modify *ParseTest.java* by adding a **catch** block for **Exception**, before the **catch** block for **ParseException**. Why does this generate a compiler error?
(Solutions: *ParseTest2.java*, *ParseTest2.txt*)

- ❷ Create an exception class called **BadAgeException**. Modify the **Person** class to contain an **age** field. Add an **int** argument to the **Person** constructor for the age. If the age given to the constructor is less than 0 or greater than 120, throw the **BadAgeException**. Modify the **UsePerson** class to test this constructor.
(Solutions: *BadAgeException.java*, *InvalidDataException.java*, *Person2.java*, *UsePerson2.java*)
